

Sheppard's Equation: A Resonance-Based Collapse Model of Observable Reality

Sheppard's Equation: A Resonance-Based Collapse Model of Observable Reality

Unifying Space, Time, and Phase via Inverse Harmonic Proxy Functions

Abstract

This paper introduces Sheppard's Equation, a unifying formalism based on resonance collapse through mismeasurement domains. Observable reality is framed as a harmonic projection filtered through time (Δt), space (Δx), and phase ($\Delta \phi$) mismatches. The result is a functional proxy (ψ_i) derived from a universal potential gradient ($\nabla \Phi$) acted upon by the inverse resonance function $R^{-1}(\mathcal{P})$. This construct integrates and generalizes foundational quantum equations by Dirac, Schrödinger, and Heisenberg under the Sheppard's Universal Proxy Theory (SUPT) framework.

Core Equation

$$\psi_i(\Delta t, \Delta \phi, \Delta x) = \nabla \Phi \circ R^{-1}(\mathcal{P})$$

Terms

Symbol	Meaning
ψ_i	Proxy function (harmonic structure of observable form)
$\Delta t, \Delta \phi, \Delta x$	Mismeasurement differentials in time, phase, and space
$\nabla \Phi$	Gradient of the Source field (universal potential, God field)
$\mathcal{P}$	Set of measured proxy parameters
$R^{-1}(\mathcal{P})$	Inverse resonance collapse function acting on proxies

Philosophical Axioms

1. All reality is a projection of resonance collapse.
2. All error is proxy error—misalignment in measurement.
3. Truth is a return to harmonic coherence with the Source field.

Comparative Matrix

Equation	Domain	What It Measures	SUPT Equivalent
Schrödinger	Wave evolution	Energy + time	ψ_i over Δt
Heisenberg	Uncertainty	$\Delta x \cdot \Delta p \geq \hbar / 2$	Collapse threshold
Dirac	Relativistic particles	Spin, mass	ψ_i includes spin collapse
Sheppard	Unified resonance	$\Delta t, \Delta \phi, \Delta x$ collapse	$\psi_i(\Delta) = \nabla \Phi \circ R^{-1}(\mathcal{A})$

Potential Implications

- Observable form is a collapsed proxy; source truth is harmonic.
- Time is not linear—it's a resonance phase artifact.
- Quantum effects are misalignment residues, not fundamental limits.
- Memory, motion, identity are proxy fields, correctable via harmonics.

Testable Directions

- Re-derive uncertainty limits using $\Delta \phi$ collapse
- Model ψ_i fields in $\psi 8$ -Core lattice system
- Identify interference patterns from incorrect resonance
- Apply to ARC-like reasoning: geometric memory $\leftrightarrow$ phase-query retrieval

Next: Prototype + Simulator

- SVG Glyph System for visual resonance
- $\psi 8$ -Core CAD layer for physical encoding
- Field lattice sim for SUPT-based collapse testing

Connection to Existing Work

This work builds upon the foundation established in "Beyond Beauty: Reframing Euler's Identity Through Sheppard's Universal Proxy Theory" and extends the

applications explored in the ψ 8-Core™ Data Storage Simulator. The eight-dimensional lattice model (ψ_8) serves as the underlying framework for understanding how mathematical expressions function as resonant proxies for natural phenomena.
